Report generated 2026-10-01

CONTENTS

What is in this report

- 01 How this audit was produced**
Sources, method and the limits of what was measured
- 02 The ad account**
Live Meta Ad Library activity as scraped on 2026-10-01
- 03 Findings**
15 issues, each with the measurement behind it
- 04 Opportunity score**
Five weighted dimensions, scored from measured values only
- 05 Suggested next steps**
Ordered by effort against likely impact

01 METHOD

How this audit was produced

- Every figure in this report is measured, not estimated. Ad counts come from distinct Meta Library IDs parsed off the Ad Library results page — never from counting links, which inflates the number several times over.
- Technical findings come from a live headless-browser crawl of each domain, reading the rendered DOM and the network-initialised tags. Values are quoted with the measurement beside them.
- The Meta Ad Library keyword search filters by country only; it has no city filter. This business is therefore not confirmed to sit in the city that was searched, and its own ads are location-tagged Hyderabad.
- Ad destinations are not exposed in the public search results, so landing pages were not verified ad by ad. One ad detail view was opened to confirm the call to action and platform. No claim is made about the creative of the remaining ads.
- Where a value could not be measured, it is reported as unavailable. Nothing has been inferred to fill a gap.

02 LIVE META AD LIBRARY DATA

The ad account

Active ads	14 of 14 parsed from the results page
Earliest start	6 May 2026 (146 days ago)
Most recent start	23 Jul 2026
Platforms	WHATSAPP
Ad page	https://www.facebook.com/parthadentalcares/
Country scope	IN (Ad Library keyword search is country-level)

03 15 ISSUES, RANKED BY SEVERITY

Findings

CRITICAL

1. A second live domain runs with no Meta Pixel

parthadental.in returned 200 and no fbq('init','<id>') call was found in the served HTML. The primary domain parthadental.com carries pixel 574874877701349.

```
secondaryDomain: https://parthadental.in/ · secondaryMetaPixelId: null · secondaryGtm: GTM-MR62F968 ·  
primaryMetaPixel: 574874877701349 · gtmContainersDiffer: true
```

Any form fill, call click or booking that happens on the .in domain is invisible to the Meta Pixel that feeds retargeting. Ad-set optimisation therefore learns from a partial signal, and the second GTM container means the two domains are not even sharing one analytics property.

HIGH

2. Two GTM containers across two domains

https://parthadental.com/ runs GTM-WK48QHS; https://parthadental.in/ runs GTM-MR62F968.
primary: GTM-WK48QHS · secondary: GTM-MR62F968

Cross-domain measurement is not configured, so neither domain can see the other's behaviour and duplicate conversion paths cannot be de-duplicated. This is a reporting blind spot before it is an optimisation one.

HIGH

3. Every labelled ad placement is WhatsApp, and the click destination is not measurable

3 of 14 parsed ads carry the placement label WHATSAPP; the other 11 expose no placement label in the search-results DOM. Destination was not present in the search view (unavailable_from_search_results). One ad was opened directly (Library ID 1235043645135951) and showed the CTA 'Send WhatsApp message' with a second 'Book now' button. The other 13 ads were not opened individually, so their destination is unknown rather than known.

```
activeAds: 14 · parsedAds: 14 · adsLabelledWhatsapp: 3 · adsLabelledOther: 0 ·  
adsWithNoPlacementLabel: 11 · destinationSource: unavailable_from_search_results ·  
individuallyVerifiedAdId: 1235043645135951 · daysRunning: 146
```

A WhatsApp click-to-message is a first-party event, not a website event. Unless the Meta click ID is carried through the conversation, there is no join between what the ad spent and what the clinic booked. Because the destination of the remaining ads is unverified rather than proven, treat the scale of the gap as unknown; the observability problem is confirmed only for the ad that was opened.

HIGH

4. Primary domain reaches network idle slowly and ships a large document

parthadental.com returned 200 in 7307ms to networkidle2 with 470KB of HTML. parthadental.in returned 200 in 1824ms with 334KB.

primaryLoadMs: 7307 · primaryHtmlKb: 470 · secondaryLoadMs: 1824 · secondaryHtmlKb: 334

For a chain mixing organic search, paid and WhatsApp traffic this is a plausible mobile conversion drag, and it lands on the exact pages that must load fast to convert a consultation enquiry.

HIGH

5. Image accessibility and image SEO differ sharply between the two domains

parthadental.com: 5% of 77 images lack alt text. parthadental.in: 82% of 28 lack alt text.

primaryImgNoAltPct: 5 · secondaryImgNoAltPct: 82

$\{host(secondary.url)\}$ is the weaker-maintained asset by this measure. If both domains are indexed, that is an inconsistent page-quality signal across the brand's own properties.

HIGH

6. Both domains self-canonical, so neither signals which is authoritative

parthadental.com canonicalises to <https://parthadental.com/>; parthadental.in canonicalises to <https://parthadental.in/>. Each declares itself the canonical version.

primaryCanonical: <https://parthadental.com/> · secondaryCanonical: <https://parthadental.in/>

Search equity is split across two self-canonicalising hosts that serve different content and different clinic counts. This is the classic setup for the wrong version of the brand being indexed and shown in the SERP.

HIGH

7. The two published patient counts contradict each other

The homepage on parthadental.com states "10,00,000+ Patients" while the dentist-near-me page on the same host states "15,00,000+ Patients".

values: 10,00,000+ Patients, 15,00,000+ Patients · sources: <https://www.parthadental.com/>, <https://parthadental.com/dentist-near-me>

Dental and skin/hair care sit in a YMYL trust context where the same brand publishing two different volume claims on two live pages is a self-inflicted credibility problem, and an obvious one for a competitor to point at.

HIGH

8. The clinic count is stated six different ways

Values found: 120+, 125, 128+, 130+, 131+, 48 (Hyderabad & Telangana only).

values: 120+, 125, 128+, 130+, 131+, 48 (Hyderabad & Telangana only) · sources: <https://parthadental.com/dentist-near-me>, <https://parthadental.com/dental-skin-hair-clinic-multi-speciality>, <https://www.parthadental.com/>, <https://parthadental.in/>

Users who land on one page and then click to another see the number change. On a booking-intent page that is a small credibility tax, and it is trivially fixable with one canonical figure.

HIGH

9. Six phone numbers are presented as the contact number across two domains

Found: 040 4142 0000 / 040-4142-0000 / 040 414 20000 / 040 4142 0001 / 801 955 0000 / 942 942 2020. Separately, three different numbers are presented as the WhatsApp contact: +91 85007 79000 / 942 942 2020 / 801 955 0000.

phones: 040 4142 0000, 040-4142-0000, 040 414 20000, 040 4142 0001, 801 955 0000, 942 942 2020 · whatsapp: +91 85007 79000, 942 942 2020, 801 955 0000

Call tracking across numbers fragments the call source data that any of this spend would generate, and WhatsApp runs on yet another set. Attribution across phone, WhatsApp and web cannot be stitched without a single canonical contact set.

HIGH

10. Ads run from a Facebook page the website does not link to

Meta Ad Library attributes the live ads to <https://www.facebook.com/parthadentalcares/>, while parthadental.com links to <https://www.facebook.com/parthadentalskinhair>.

adsPage: <https://www.facebook.com/parthadentalcares/> · siteLinkedPage: <https://www.facebook.com/parthadentalskinhair>

Pixel and audience data accumulate against the page running the ads, but the landing experience points visitors at a different page. Social proof and retargeting audiences are split across two identities for one brand.

MEDIUM

11. Ad destinations are not exposed in the public search results

destinationSource=unavailable_from_search_results. The collapsed card exposes no outbound landing-page anchor.

destination: null

Stated as a limitation of this audit rather than a fault at the business. Landing pages were not verified per-ad and no individual ad was opened, so nothing beyond the collapsed search-results card is confirmed.

LOW

12. No Google Ads tag on the primary domain

No AW- conversion ID and no UA- property found in `${host(primary.url)}` HTML.

gads: false · gaUa: false

Not a defect if search is not a channel. Worth confirming: if any branded or non-branded search spend exists, it is currently not returning conversion data to the account.

NOTE

13. Meta Pixel is live on the primary domain

parthadental.com runs Meta Pixel id 574874877701349, GTM GTM-WK48QHS, GA4 R88QYYGQ8J.

pixel: 574874877701349 · gtm: GTM-WK48QHS · ga4: R88QYYGQ8J

Standard instrumentation is present. The problem is not absence of tracking, it is that tracking is fragmented across properties.

NOTE

14. This is an enterprise account, not a single-clinic owner

This is a 130+ clinic enterprise chain with 300+ doctors and four states, not a single-location clinic. An in-house or retained marketing team is likely, so the 'wasting ad spend' pitch does not apply.

buyer: Likely a digital marketing manager or marketing head, not the founder.

Position as a measurement / brand-governance and multi-domain problem for a marketing decision-maker, not a cost-cutting offer to a clinic owner.

NOTE

15. Sustained paid activity

14 active ads, earliest start 6 May 2026, i.e. 146 days live as of the 2026-09-29 scrape. Latest start 23 Jul 2026.

activeAds: 14 · earliestStart: 6 May 2026 · latestStart: 23 Jul 2026 · daysRunning: 146

The creative and offer are working enough to be kept on. The gaps documented here are measurement and consistency gaps, not a failed campaign, which is what makes them safe to raise.

QUALIFICATION

Read this before acting on it

This is a 130+ clinic enterprise chain with 300+ doctors and four states, not a single-location clinic. An in-house or retained marketing team is likely, so the 'wasting ad spend' pitch does not apply.

Position as a measurement / brand-governance and multi-domain problem for a marketing decision-maker, not a cost-cutting offer to a clinic owner. Likely buyer: Likely a digital marketing manager or marketing head, not the founder..

05 ORDERED BY EFFORT AGAINST IMPACT

Suggested next steps

LOW EFFORT, IMMEDIATE BENEFIT

1 Decide which domain is canonical

Pick one of parthadental.com / parthadental.in as the single brand host. 301 the other, or point its canonical at the chosen one. This resolves the self-canonical conflict at the source.

UNDER AN HOUR

2 Install the Meta Pixel on every live domain

Until every host fires the same pixel ID, retargeting is learning from a partial signal. Verify with Meta Pixel Helper after install.

HALF A DAY, BIGGEST SINGLE WIN

3 Carry the Meta click ID into the messaging path

3 of 14 ads are labelled as messaging placements, and the click destination is not exposed in the public search view. Passing the click ID into the conversation is what turns 146 days of spend into something measurable. The other 11 ads carry no placement label, so the split between a WhatsApp click and a website click cannot be read from the public view. 13 of the 14 ads have not been opened individually yet, so their destination is still unstated in this report.

UNDER AN HOUR

4 Consolidate the tag containers

GTM-WK48QHS and GTM-MR62F968 are running as separate containers, so neither domain can see the other's behaviour.

UNDER AN HOUR

5 Publish one canonical set of numbers

Settle on a single set of volume claims and use it on every page. Removes a self-inflicted trust problem that a competitor can point at.

UNDER AN HOUR

6 Consolidate contact points

One canonical phone number and one canonical messaging number, used on every domain, with call tracking pointed at them.

NEXT STEP

Happy to walk through any of this on a short call.

Nothing here requires new tooling. The first three items are configuration, not rebuilds.
